

# Fleet LogiX

## Transport Management System

Fleet LogiX is designed to assist the Transport Fleet Operator in the daily management of a road freight fleet. It enables the Operator to proactively schedule a fleet, taking into account various relevant factors, such as order information, resource availability and process constraints all folded into a comprehensive trip-based costing facility. The system's scheduling objective is to optimise resource utilization and profit.

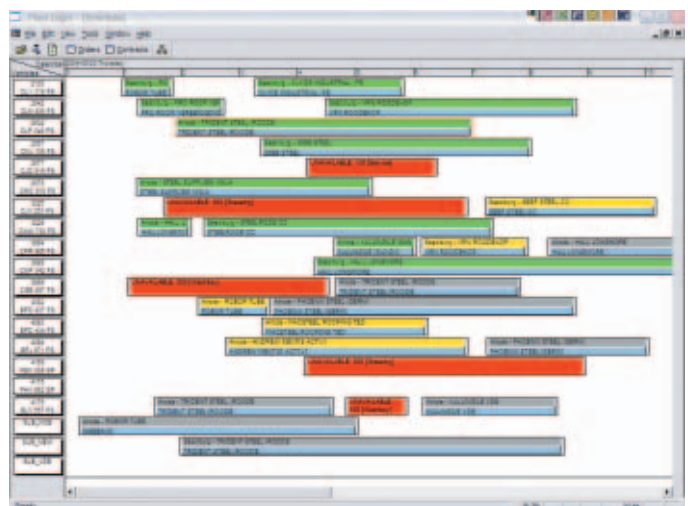

## Integration with Financial System

The System has been integrated successfully with certain financial accounting systems, such as Great Plains Dynamics. The integration is aimed on sharing relevant information with the financial system in order to facilitate debtors, or accounts payable.

Fleet operators will typically use this system to plan and schedule vehicle movements, driver allocation, order processing, trip documentation management and invoicing.

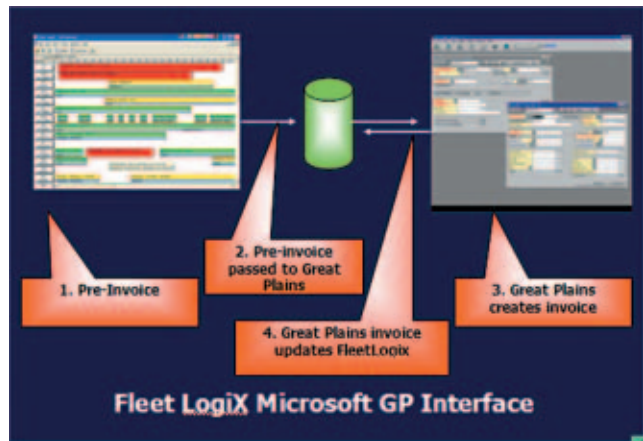

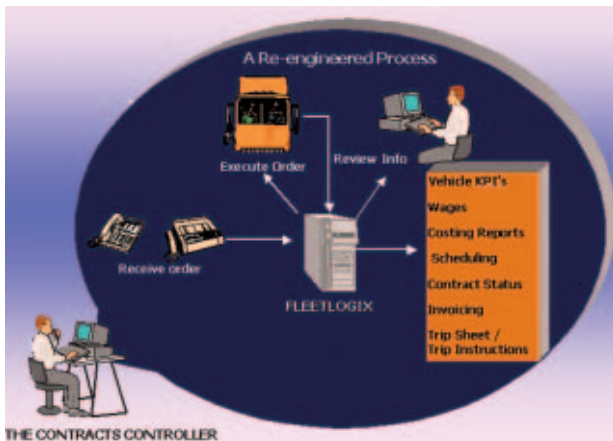

## Features

- Scheduling
- Despatch Management
- Contract Information Management
- Payment/Invoicing Processing
- Reporting

## Fleet LogiX Processes

## Benefits

Companies using the system can expect to gain advantage from the following:

- A central, and dynamic view, of all vehicle activities during any given period.
- Operating cost reduction offered through process visibility.
- Increased profits by managing productivity related issues, e.g. excessive offloading times by destination, driver activities, payloads etc.
- A packaged solution based on best practice, functionality, relevance to the industry and ease of operating.
- Increased customer satisfaction resulting from transporter's ability to provide accurate, relevant and timely information.
- Quick and easy system installation.
- Affordability.
